

Geometry – G.CO.2 – Introduction and Exploration

1. Plot $\triangle ABC$ with $A(-9, 8)$, $B(-4, 4)$ and $C(-1, 6)$.

Now, for each of your vertices of $\triangle ABC$, TRANSFORM the coordinates in the following way:

$$Z(x, y) \rightarrow Z'(x + 5, y - 7)$$

For example, suppose we TRANSFORM point A from your triangle.

$$A(-9, 8) \rightarrow A'(-9 + 5, 8 - 7) \rightarrow A'(-4, 1)$$

So, your new point called A' (you would say "A prime") would be at $(-4, 1)$.

Now, transform B and C into B' and C' .

$$B' (\quad , \quad) \qquad C' (\quad , \quad)$$

Plot $\triangle A'B'C'$.

Describe (in at least one complete sentence) how the $\triangle A'B'C'$ is different than $\triangle ABC$.

Geometry – G.CO.2 – Introduction and Exploration

2. Now, replot $\triangle ABC$.

Now, transform A, B and C in the following way:

$$Z(x, y) \rightarrow Z'(x, -y)$$

$$A' (\quad , \quad) \quad B' (\quad , \quad) \quad C' (\quad , \quad)$$

Plot $\triangle A'B'C'$.

Describe (in at least one complete sentence) how the $\triangle A'B'C'$ is different than $\triangle ABC$.

Geometry – G.CO.2 – Introduction and Exploration

3. Now, replot $\triangle ABC$.

Now, transform A, B and C in the following way:

$$Z(x, y) \rightarrow Z'(-y, x)$$

$$A' (\quad , \quad) \quad B' (\quad , \quad) \quad C' (\quad , \quad)$$

Plot $\triangle A'B'C'$.

Describe (in at least one complete sentence) how the $\triangle A'B'C'$ is different than $\triangle ABC$.
